

Phishing Anatomy

Suspicious Sender Address

- Email might look close to a real domain (e.g., support@paypai.com instead of paypal.com)
- Attackers often use lookalike domains or random email providers

Urgent or Scary Subject Lines

- “URGENT: Action Required Immediately”
- “Your Account Will Be Suspended”
- Phishers love urgency—it short-circuits your decision-making

Generic Greetings

- “Dear Customer,” or “Hello User”
- Legit companies often use your name if you're a customer

Hyperlinks That Deceive

- Text says: www.bank.com
- But the actual link goes to: www.banc-security-alerts.ru
- Always hover over links to see where they really go

Unexpected Attachments

- PDF, ZIP, or Word docs that install malware
- If you weren't expecting an attachment, don't open it

Poor Spelling or Grammar

- Many phishing emails come from non-native speakers or use AI tools that miss context
- Legitimate companies usually proofread their communication

Spoofer Logos or Branding

- Looks official at first glance but may have:
 - Pixelated logos
 - Outdated layouts
 - Fake footer information

Key Takeaway

Phishing emails are crafted to make you react without thinking. Pause, read carefully, and check the details before clicking anything.
