

Phishing Reporting

When you receive a phishing email ...

The worst thing you can do is nothing because

- Others in your company or contact list may receive the same message.
- Ignoring it leaves attackers free to keep trying.
- Reporting helps IT and security teams take action quickly.

Step 1

- Do Not Click or Reply
 - Don't engage with the email in any way.
 - Avoid opening attachments or clicking links.

Step 2

- Check for obvious red flags
 - Review the checklist you learned earlier.
 - If anything feels off—treat it as suspicious.

Step 3 (Report it)

- At Work:
 - Use your company's reporting tool (like the "Report Phish" button in Outlook or Gmail).
 - Notify your IT or security team directly.
 - Forward the email if requested (but do not download or open attachments).
- Personal Email:
 - In Gmail, click the three dots > "Report phishing."
 - In Outlook, click "Report" > "Report phishing."
 - Most email platforms have this feature.

Step 4

- Warn others (If Appropriate)
 - If the email claims to be from your boss, coworker, or vendor—let them know they may have been impersonated.
 - This helps them be alert and avoid spreading the threat further.

Step 5

- Delete the Email
 - Once it's been reported and documented, delete it from your inbox.
 - Also clear it from your trash or spam folder.

What NOT to Do:

- Don't forward the email to friends or coworkers without warning—especially if it has links or attachments.
- Don't screenshot sensitive parts if the email contains personal data.
- Don't ignore it and hope someone else catches it.

Key Takeaway

The moment you suspect a phishing email is the moment to act. Quick reporting can protect you, your organization, and others from serious harm.
